***Applicant's Response***

1. In Applicant's Response dated 05/28/2008, Applicant amendments to the claims and corresponding arguments are persuasive.

All objections and rejections previously set forth are withdrawn.

***Allowable Subject Matter***

2. Claims 1-25 are allowed.
3. The following is an examiner's statement of reasons for allowance

*Claims 1, 18, and 19*

The closest prior art of Goodrich et al (7111018) teaches a process of generating a topology of electrically connected power circuits on a grid and displaying the power supplies in a graphical interface. Goodrich derives the device information by accessing a database to determine the connected information and the database is populated by EMS providers. Goodrich does not teach simulating a sequence of power supplies during a start-up or shut-down sequence and reflecting the start and stop process in the user interface and is not seen as teaching a process of controlling the power supplies based on configuration information that is derived from the topology of the devices in the power system.

Siemens "system simulator operations" teaches a simulator to control the starting and stopping of a power circuit. Siemens teaches checking the circuits during a simulation process. The claims now recite that the sequencing is now performed during the operation of the power system. Siemens is also not seen as teaching a process of controlling the power supplies based on configuration information that is derived from the topology of the devices in the power system.

Bjorklund teaches a system that allows an operator to start, stop, reverse and adjust power supply output via a human machine interface. Bjorklund teaches the operator can manager or access a power substation via a laptop computer to measure output of the power supply. Each element in the display can be accessed by clicking an icon. While Bjorklund suggests the

Art Unit: 2179

interface can be used in power plants, car assembly plants, etc and teaches that someone can start and stop power supplies, Bjorklund does not teach allowing the user to create a start and stop sequence for a set of power supplies and then feeding the process to a control system to control the power supplies in accordance with the user inputs. Bjorklund teaches the user reads values from a circuit diagram with superimposed values applied to the diagram. In contrast the claims state determining a topology of the system by relating the characteristics and connections to the power supplies to determine the topology. Therefore, the prior art is not seen as teaching the claims as a whole and are considered allowable over the prior art.

*Claims 2-17 and 20-25*

These claims are dependent upon Claims 1 and 19, and are thus allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Steven B. Theriault whose telephone number is (571) 272-5867. The examiner can normally be reached on M-F 7:30 - 4:00 PM.
